

Improved Flight Following Tool

Tracking your flight takes on a whole new appearance!

We invite you to experience our improved flight following tool that is faster, more accurate and easier to use. The new Google Map graphical interface makes it simple for users on the ground to track your flight, spot turbulence and view weather patterns that may cause flight delays.

The new feature includes:

- Datalink communicates easily with fleet aircraft
- Access to historical uplink and downlink messages, and position reports
- Worldwide airport and VHF station locator
- Customized screens
- Views in Spherical 3D mode

The Global Data Center (GDC) team will continue to support the existing flight following interface for 1 month. After May 14th, 2010, we'll decommission the tool and transition all customers to the new interface.

If you have any questions, suggestions or comments, please contact the GDC team by phone 1-888 634-3330 or 425-885-8100 or email gfo@mygdc.com.
